Claim 2; Fig 2; 36pp; English.

The present invention relates to the isolation of the cotton fibrespecific actin gene, CFACT1, which includes the promoter sequence. The
cotton CFACT1 gene promoter controls specific gene expression at the
transcriptional level in cotton fibres. It is useful for improving cotton
fibres to create new cotton varieties with high fibre quality and yield,
by gene manipulation methodologies. The promoter is also useful for
creating transgenic plants, particularly cotton, having altered fibre
characteristics, and permits selective expression of a transgene in the
cotton fibre, permitting greater latitude in the types of transgenes

Examples of expression of desirable genes in cotton fibres, but not in other parts of the cotton plants, include anthocyanin genes for coloured cotton, silk protein genes from silk worm or spiders for increased strength cotton fibres, and biosynthesis of polyhydroxybutyrate in cotton fibres for improved thermal properties and insulating characteristics. The present sequence represents the cotton CFACT1 gene

                                                                                                                                                          δÃ
                                                                                                                                                                                The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders cassociated with at least 1 gene and/or their regulatory regions in a cuspicct. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPS) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                            Query Mato

The present invention describes a method differentiating between haematopoietic conssociated with at least 1 gene and/or the subject. The method comprises contacting biological sample obtained from the subject.
                                                                                                                    wpi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                equences and their complements; and as primers for the tion of haematopoietic cell proliferation disorder. The nucleotide sequences from the present invention can also or detecting a predisposition to, differentiation between s, diagnosis, prognosis, treatment and/or monitoring of ietic cell proliferative disorders. The present method enables ecific classification of haematopoietic cell proliferative allowing for improved and informed treatment of patients.
ating between healthy haematopoietic cells and proliferative aematopoietic cells; for differentiating between acute c leukaemia and acute muelcoencer levels.

Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNI sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between

Detecting and disorders, co distinguishes d differentiating between hematopoietic cell proliferative omprises contacting a target nucleic acid with a reagent to between methylated and non-methylated CpG dinucleotides. that

Claim 28; SE( ID NO 240; 117pp; English.

subject. The biological sawhich disting dinucleotides differentia associated represent invention. differenti present spe at ε invention describes a method for detecting and ing between haematopoietic cell proliferative disorders ith at least 1 gene and/or their regulatory regions in a method comprises contacting a target nucleic acid in a ample obtained from the subject with at least 1 reagent, guishes between methylated and non-methylated CpG is within the target nucleic acid. ABZ09861 to ABZ11118 ecifically claimed nucleotide sequences from the present ligonucleotides from the present invention can be used: ing between healthy haematopoietic cells and proliferative on can be used: fo and proliferative

The nucleotide sequences from the present invention can be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enal highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polymorphisms (SNPs) of haematopoietic cell related sequences and their complements; and

                                                                                                                                                                                                                                                                                                                                                                                                    present sequence encodes a SC4 protein. The promoter of this gene is ferentially expressed in seed coat tissues, specifically within the er integument, the inner integument, the thick walled parenchyma, the nwalled parenchyma, the endothelium, the hourglass cells, the isade, the stellate parenchyma, or the membranous endocarp associated the seed coat. The seed-coat promoters may be used to express teins of interest in seed coat tissues. Genes of interest include but not restricted to herbicide resistance genes, genes encoding viral t proteins, or genes encoding proteins conferring biological control pests or pathogens, e.g. a Bt toxin. Other genes that may be expressed lude proteins that alter the taste of the seed and/or affect the

                                                                                                                a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (I) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                     prostate cells for detecting ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W0200160860-

chemically modified gene, useful associated with abnormal cytosine

ID NO 1542; 32pp + Sequence Listing; German.

sent invention provides a number of human immune system associated hich are modified by the methylation of cytosines. The sequences used in the diagnosis and treatment of immune system disorders, ng eye diseases such as retinopathy, neovascular glaucoma and degeneration, arteriosclerosis, anaemia, cancer, acute myeloid ia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, oid arthritis, psoriasis and inflammatory/ulcerative bowel s. The present sequence is a gene of the invention

11.1%; Score 90.2; DB 6; larity 50.1%; Pred. No. 0.0052; Conservative 0; Mismatches 273; BP; 2163 A; 185 C; 2060 G; 3897 T; 0 U; 0 Other; Length 8305; Indels 10; 2

complementary to (Ss). The nucleic acid may be a peptide nucleic acid-
coligomer (PNA) of at least 9 nucleotides and may form part of a set of
coligomer (PNA) of at least 9 nucleotides and may form part of a set of
currobes for detecting the cytosine methylation state and/or single
nucleotide polymorphisms and also to be used in an array for analysing
diseases associated with CpG dinucleotides e.g. cancers and tumours. The
currobes can also be used in a method for ascertaining genetic and/or
currobes can also be used in a method for ascertaining genetic and/or
currobes can also be used in a method for ascertaining genetic and/or
currobes can also be used in a method for ascertaining genetic and/or
currobes can also be used in a method for ascertaining genetic and/or
currobises or the predisposition to specific diseases, by analysing
currobise methylations. The parameters may be compared to another set of
currobise and/or epigenetic parameters, the differences serving as basis
currobised from tumour suppressor genes and oncogenes. Note: The sequence
currobise patent did not form part of the printed specification, but
currobised in electronic format directly from WIPO at

                          identical to a chemically pretreated DNA of genes associated with pharmacogenomics and their complements, arranged in an array for analysing diseases associated with the methylation state (CpG) and detecting SNPs (single nucleotide polymorphisms) of the 87 sequence oligomers may also be used as PCR primers. The set of 87 nucleic and their complements is useful for diagnosis and therapy of solic tumours and cancer. The present sequence represents one the 87 DNF sequences or its complement. Note: The sequence data for this pate not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                               sequences

between colon cell proliferative disorders associated with at least one gene or its regulatory regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one least one reagent or a series of reagents, where the reagent or series of connucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful disorders, including cancers such as colon cell proliferative of the PNA (peptide nucleic acid)-oligomers are useful as probes for determining cytosine methylation state or single nucleotide polymorphisms. The current sequence is that of the pretreated genomic DNA region of the invention. This sequence is not shown within the specification but is taken from Wipoweb. DNA 0f

Query Ma Best Loc Matches The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequence can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention Sequence Match Similarity 6602 10.8%;
larity 48.8%;
